Experiment 3

Student Name: Sarthak Arora

Branch: CSE

Semester: 5th

Subject Name: ADBMS

UID: 23BCS12984

Section/Group: KRG_2B

Date of Performance: 18/08/25

Subject Code: 23CSP-333

1. Aim:

To design and implement SQL queries for creating tables, inserting data, and retrieving meaningful information using relational concepts.

- To apply aggregate functions, joins, subqueries, and set operations for solving database problems.

Part A – Easy Level:

- To create a table for storing employee IDs and insert sample data.
- To identify and retrieve the maximum employee ID that does not have duplicates.

Part B – Medium Level:

- To create department and employee tables with a foreign key relationship.
- To retrieve the employee(s) having the highest salary in each department using joins and subqueries.

Part C – Hard Level:

- To create two tables containing employee details with salaries.
- To combine the tables and retrieve the minimum salary for each employee using grouping and aggregate functions.

2. Objective:

- To understand the use of GROUP BY and aggregate functions for filtering data.
- To apply joins and subqueries for department-wise salary analysis.
- To implement foreign key relationships for relational database design.
- To use UNION ALL and grouping for analyzing data across multiple tables.
- To strengthen SQL query writing skills for handling duplicates, aggregation, and joins.

3. ADBMS script and output:

EASY-LEVEL PROBLEM

```
CREATE TABLE Employeee (  
    EmpID INT ,  
);  
  
INSERT INTO Employeee (EmpID) VALUES  
(2),  
(4 ),  
(4),  
(6),  
(6),  
(7),  
(8),  
(8);
```

```
Select Max(EmpID) as [Maximum ID] from (Select EmpID from Employeee Group by EmpID  
having Count(*) < 2)as Subquery;
```

MEDIUM LEVEL PROBLEM:

```
CREATE TABLE departmentt (  
    id INT PRIMARY KEY,  
    dept_name VARCHAR(50)  
);  
  
CREATE TABLE employeeeee (  
    id INT,  
    name VARCHAR(50),  
    salary INT,
```

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

Discover. Learn. Empower.

```
department_id INT,  
FOREIGN KEY (department_id) REFERENCES departmentt(id)  
);  
INSERT INTO departmentt (id, dept_name) VALUES  
(1, 'IT'),  
(2, 'SALES');  
INSERT INTO employeeeee (id, name, salary, department_id) VALUES  
(1, 'JOE', 70000, 1),  
(2, 'JIM', 90000, 1),  
(3, 'HENRY', 80000, 2),  
(4, 'SAM', 60000, 2),  
(5, 'MAX', 90000, 1);  
Select d.dept_name,e.name,e.salary from departmentt as d Join employeeeee as e on d.id =  
e.department_id where e.salary in (  
Select max(e2.salary) from employeeeee as e2 where e2.department_id = e.department_id);
```

HARD LEVEL PROBLEM

Create table A1 (ID int , Ename varchar(50), Salary int);

Create Table B1(ID int, Ename varchar(50), Salary int);

Insert into A1 values(1,'AA',1000);

Insert into A1 values(2,'BB',300);

Insert into B1 values(2,'BB',400);

Insert into B1 values(3,'CC',100);

Select ID, EName, Min(Salary) as Min_Salary from

(Select * from A1 Union All Select* from B1) as combined Group by Ename,ID;

OUTPUTS:

Results		Messages
	Maximum ID	
1	7	

Figure 1: Easy Level Problem

	dept_name	name	salary
1	SALES	HENRY	80000
2	IT	MAX	90000
3	IT	JIM	90000

Figure 2: Medium level Problem

	ID	EName	Min_Salary
1	1	AA	1000
2	2	BB	300
3	3	CC	100

Figure 3: Hard Level Problem
